# SURGICAL TECHNIQUE

## Approach

- Lateral approach centered on the scaphotrapezial joint space.

## Scaphoid preparation

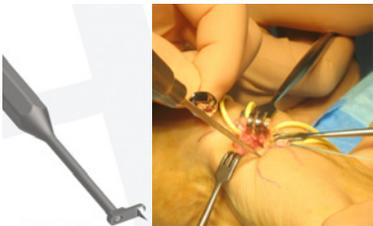

- Resection of the scaphoid distal pole (2mm).
- Remove the cut bone part.
- Measure the size of this removed part using the gauge (MIAGT001) to determine the size of the implant required.

### IMPORTANT

if the measurement of the resected bone part is between the 2 sizes of the gauge, you will have to choose the smaller size. Do not oversize the implant

- Using the shifted peak (MIAPC001), mark the entry point of the rasp for preparing the passage of the implant keel.

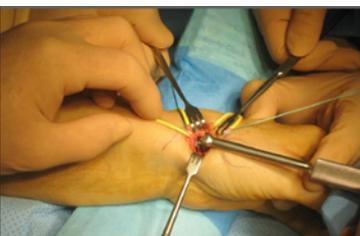

- Push in the rasp (MIARQ002) to create the location of the keel.

## Implant placement

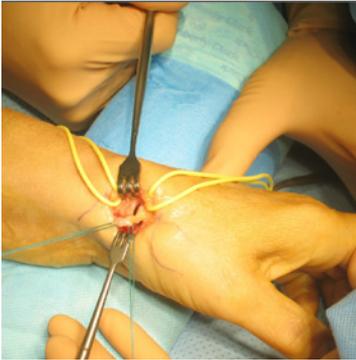

- Position the implant determined by the initial measurement by placing the keel in the hole made in the scaphoid.

- Impact the implant using the impactor (MIAID001).

- Close the capsular flap.
- Immobilize for 6 weeks.

### Implant removal

An osteotome can be used for removing the implant if necessary.

# IMPLANTS

#### INCA™ STT PROTHESIS

- cobalt-chromium-molybdenum alloy.
- cementless fixation: titanium + HA coating.
- anatomical bearing surface with mirror-polished finish.
- keel ensuring primary stability.
- sterilized by Gamma irradiation.
